The global Enamel Grade Titanium Dioxide market size is predicted to grow from US\$ 1236 million in 2025 to US\$ 1761 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Enamel grade titanium dioxide is a specialized grade of TiO_2 designed for use in enamel applications. It typically features the anatase crystal form or specially treated rutile form, offering excellent thermal stability, chemical resistance, and opacifying power. This grade resists reduction and discoloration during high-temperature firing, enhances the whiteness, brightness, and opacity of enamel coatings, and provides a smooth, glossy finish. It is widely used in household enamelware, architectural panels, and heating appliance coatings. Compared to pigment grade TiO_2 , enamel grade requires stricter control of impurities such as iron, potassium, and sodium to ensure color stability and performance during firing.

The enamel grade titanium dioxide market is steadily expanding, driven by sustained demand from household enamelware, architectural cladding, and heating appliances—especially in emerging economies undergoing rapid urbanization. Stringent requirements for high whiteness, opacity, and thermal reduction resistance mean that producers must tightly control impurity levels, particularly iron and alkali metals. While the global market is still dominated by a few established suppliers with mature refining and surface treatment technologies, Chinese manufacturers are rapidly improving quality and process control, aiming to capture more mid-range applications. Environmental regulations phasing out traditional toxic frits (e.g., lead-based) are increasing the technical demands on enamel-grade TiO_2 , further stimulating R&D into high-dispersion and high-durability formulations.
