Encapsulated calcium propionate is a food preservative in which calcium propionate, a mold and bacteria inhibitor, is covered in a protective coating. This encapsulation technique improves the stability and regulated release of calcium propionate in food products, resulting in longer shelf life. The coating, which is often constructed of food-grade materials, limits direct interaction with the food matrix, reducing the possibility of taste, texture, or quality modifications. Encapsulated calcium propionate is used in a variety of food products, providing a dependable solution for manufacturers looking to maintain freshness and safety while retaining flavor characteristics in the constantly evolving environment of food processing and preservation.

The global Encapsulated Calcium Propionate market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
