The Gait Trainer (walking training system) is an innovative medical device developed for patients with movement disorders due to stroke, SCI, TBI, multiple sclerosis, cerebral palsy and other neurological rehabilitation-related diseases. When the brain area related to walking is damaged, people may lose the ability to walk. Fortunately, through rehabilitation therapy, it is possible to regain the lost memory of walking. This is called 'neuroplasticity'. The goal of rehabilitation therapy is to maximize the patient's neuroplasticity and restore walking function. Robotic walking training can provide repeated practice, concentrated training, and individual training, and is known as the best way to stimulate neuroplasticity.
