'Endoscopic reprocessing medical device' means a medical device used in the reprocessing of endoscopic equipment used for the examination and treatment of internal organs or cavities. An endoscope is a medical tool that allows doctors to directly observe and manipulate a patient's internal organs through its elongated tube-like structure and lens without performing open surgery.

Endoscope reprocessing refers to cleaning, disinfecting, and sterilizing the endoscope after use to ensure that the instrument is sterile, safe and reliable the next time it is used. This process is very important because during endoscopy and treatment, instruments may come into contact with the patient's blood, body fluids, etc., and if not properly reprocessed, infectious diseases may be transmitted.

The global Endoscope Reprocessing Medical Device market size is projected to grow from US\$ 520 million in 2024 to US\$ 827 million in 2030; it is expected to grow at a CAGR of 8.0% from 2024 to 2030.
