The endoscopy insufflator is a medical device used during endoscopic procedures to inflate the gastrointestinal tract or other cavities of the body with gas. The insufflation of gas helps to enlarge the area being examined, providing better visibility for the physician performing the procedure. Insufflators are typically used during procedures such as colonoscopies, upper endoscopies, and laparoscopic surgeries. The most common gas used in endoscopy insufflation is carbon dioxide, which is safe and well tolerated by most patients.

The main consumer market of Endoscopy Insufflator is in North America and Asia Pacific region. With the gradual recovery of the global economy after the COVID-19 outbreak and the return of major economies to normal, the medical industry will see certain growth. As global medical standards continue to improve, more and more hospitals and clinics are able to perform endoscopic surgery. Therefore, the demand for Endoscopy Insufflator will increase within the foreseeable period of time.
