Endotracheal suctioning devices are classified under the respiratory suctioning devices. Endotracheal suctioning devices are broadly used to remove saliva and thick mucus along with other secretions from the trachea, mouth or the lower airway. These endotracheal suctioning devices are used on patients who finds it difficult to mobilize their secretions. A large patient pool suffering with neuromuscular disease, neurological deficits or sedation are unable to clear their own airway. Also, intubated patients with an artificial airway creates a huge demand for endotracheal suctioning devices while being on a ventilator.
