An endovascular snare is a specialized medical device used in minimally invasive procedures to capture and retrieve foreign objects or embolic materials from within the vascular system. It typically consists of a flexible catheter with a loop or 'snare' at the end, which can be manipulated to encircle and secure the target object, such as blood clots, foreign bodies, or misplaced devices.

Endovascular snares are commonly used in interventional radiology and cardiology, enhancing the safety and efficacy of procedures by allowing physicians to remove obstructions or unwanted materials without the need for open surgery. Their design enables precise maneuverability within blood vessels, facilitating effective interventions in complex vascular environments.
