The global Endpoint and Chamber Health Monitors market size is predicted to grow from US$ 50.7 million in 2025 to US$ 77 million in 2031; it is expected to grow at a CAGR of 7.2% from 2025 to 2031.

End-point detection (EPD) is essential for many wafer etch applications to ensure processes are carefully controlled and consistent, to ensure reliable results are achieved wafer-after-wafer, and optimize device yields.Endpoint detection is primarily performed to indicate the completion of a chamber cleaning process or to indicate when a wafer layer is etched through. Deposition chambers usually go through a cycle of chamber wall seasoning, wafer processing and chamber cleaning. Incomplete cleaning can cause cross contamination between different plasma recipes, and it can interfere with the seasoning, a major cause of chamber arcs and particle creation.
