Energy pellets are a type of biofuel made with the compaction of waste residues. Pellets are small log-shaped particles with a diameter of 8mm to 20mm. Due to smaller size, Energy pellets as compared to biomass briquettes can be easily used in automatic boilers for heat generation.

Before turning into energy pellets, a specific series of processes are followed, including crushing materials to the correct size, reducing the moisture content, pelletizing, cooling, packaging, etc. After processing, the combustion and density of materials increases and give the pellets a higher combustion value and a uniform size. Energy pellets offer a wide range of applications for boilers, power plants, factories, and household needs.

The global Energy Pellets market size is projected to grow from US\$ 9156 million in 2024 to US\$ 14030 million in 2030; it is expected to grow at a CAGR of 7.4% from 2024 to 2030.
