The positive electrode material of energy storage batteries is a key factor in determining battery performance, usually including lithium iron phosphate (LiFePO₄), nickel cobalt manganese oxide (NCM) and nickel cobalt aluminum oxide (NCA). These materials have their own characteristics: lithium iron phosphate is known for its excellent thermal stability and long cycle life, and is suitable for energy storage applications that require high safety and long-term stability; nickel cobalt manganese oxide is widely used in various energy storage systems due to its high energy density and balanced performance; nickel cobalt aluminum oxide has an extremely high energy density and is suitable for occasions with high energy storage requirements. Selecting the appropriate positive electrode material can not only improve the energy density and efficiency of energy storage batteries, but also extend the service life and safety of the battery, ensuring efficient and stable energy storage and release in various energy storage applications.
