The global Energy Storage Boost Inductor market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Energy storage boost inductor is a special inductor that not only has the function of energy storage in the circuit, but also can achieve voltage increase under a specific working mode. Specifically, when current passes through an inductor, the inductor converts electrical energy into magnetic energy and stores it; when the current changes (such as power failure or current reduction), the magnetic energy stored in the inductor is converted into electrical energy and released. In this process, an induced electromotive force can be generated, thereby increasing the voltage.

Energy storage boost inductors are widely used in various circuits that require voltage boost and energy storage, such as boost power supplies, DC-DC converters, inverters, etc. In these applications, energy storage boost inductors can not only provide a stable output voltage, but also smooth current fluctuations through energy storage, thereby improving the stability and efficiency of the circuit.

The development status and dynamics of the energy storage boost inductor market can be analyzed from multiple aspects.

First, as an important component of the energy storage system, the market size of energy storage boost inductors continues to expand with the rapid development of the energy storage industry. With the advancement of global energy transformation and sustainable development goals, energy storage technology is increasingly used in power system peak and frequency regulation, new energy vehicles, microgrids, data
