An energy storage flywheel is a mechanical device used to store and release energy by utilizing the rotational kinetic energy of a spinning mass. The flywheel consists of a rotor that spins at high speeds within a low-friction environment, typically a vacuum chamber. When energy is supplied to the system, it accelerates the rotor, storing energy in the form of rotational motion. This energy can then be quickly released by slowing down the rotor, providing a rapid and efficient power supply. Flywheel energy storage systems are known for their high power density, long cycle life, and quick response times, making them suitable for applications such as grid stability, renewable energy integration, uninterruptible power supplies (UPS), and transportation. They offer a sustainable and reliable method for energy storage, contributing to enhanced energy management and efficiency.

The global Energy Storage Flywheel market size is projected to grow from US$ 230 million in 2024 to US$ 405 million in 2030; it is expected to grow at a CAGR of 9.9% from 2024 to 2030.
