Energy tower heat pump is a new device with a tower shaped appearance, using air as the heat source, and achieving multiple functions such as cooling, heating, and providing domestic hot water through the heat exchange between the tower body and air. Although the heat source of the energy tower heat pump system also comes from the air, it is different from the traditional air source heat pump that obtains energy from the air. Instead, it uses a water source heat pump to absorb low-grade heat sources from the air in the energy tower for cooling, heating, and providing domestic hot water.
