## Abstracts

The global Engine Emissions Testing market size is predicted to grow from US\$ 1081 million in 2025 to US\$ 1664 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

Engine emission testing refers to the process of measuring and evaluating pollutant emissions from internal combustion engines (gasoline, diesel, natural gas, or alternative fuel engines) through laboratory bench testing or real-world operating condition testing. Its core purpose is to verify whether engine emissions under different operating conditions comply with environmental regulations (such as Euro, EPA, China VI, etc.) and is used for engine R&D optimization, type approval, production conformity checks, and in-use monitoring. Testing typically focuses on key pollutants such as NO<sub>x</sub>, CO, CO<sub>2</sub>, HC, and PM/PN, while also evaluating fuel economy and emission control system performance.

Increasing concerns about air quality and environmental sustainability have led to stricter emission regulations for both vehicle and industrial engines. Governments and regulatory bodies worldwide are imposing more stringent emission standards, driving the demand for accurate and reliable emissions testing equipment. The automotive industry's shift toward electric and hybrid vehicles, as well as the exploration of alternative fuels, is influencing the emissions testing market. Testing methods and equipment are adapting to assess emissions from these new powertrain technologies.
