The engine integrated valve cover, also known as the valve cover or valve cover, is an important part of the engine and is located above the cylinder head. Its main function is to protect the engine's valve mechanism, including valves, rocker arms, camshafts, etc., from dust, impurities and other external contaminants. It also plays the role of sealing the lubricating oil, ensuring that the lubricating oil inside the engine does not leak out, maintaining the lubrication state of all parts of the engine, thereby extending the service life of the engine components. Valve covers are usually made of materials such as steel, aluminum or high-performance plastics, which are heat-resistant and corrosion-resistant to adapt to the high temperatures and pressure changes in the engine operating environment. It is usually designed with a ventilation device that communicates with the crankcase to balance the internal pressure of the engine and prevent oil leakage and excessive wear of components. In terms of maintenance, the valve cover is fixed with bolts for easy disassembly and repair. Regularly checking the sealing status of the valve cover and the quality of the lubricating oil can ensure the normal operation and efficient performance of the engine. Overall, the engine integrated valve cover is an indispensable protection and sealing component in the engine system, ensuring the normal operation of the engine valve train and the overall stability of the engine.

The global Engine Integrated Valve Covers market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
