The global Engineered Cementitious Composite market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Engineering cement composite material is a new type of building material composed of cement matrix and other materials (such as fiber material, granular material, etc.), which has high strength, durability and crack resistance, and is widely used in construction projects. Engineering cement composite materials are usually made by mixing cement, fiber materials and granular materials in a certain proportion, and are made through multiple processes such as adding water, mixing, vibrating, and molding. Fibrous materials can increase the toughness and tensile strength of the material, and granular materials can increase the compactness and durability of the material.

According to the Japan Cement Association, Japan's cement industry emitted about 40 million tons of carbon dioxide in 2020. And the cement industry became the fourth largest source of carbon dioxide emissions in the industrial sector after electricity, steel and chemicals. 60% of the cement industry's carbon emissions come from process emissions, 35% from combustion emissions and 5% from indirect emissions from electricity. According to our 'Building Materials Research Institute', the global clinker capacity in 2022 was about 3.55 billion tons, and the global cement production was about 4.0 billion tons. According to the National Bureau of Statistics, China's cumulative cement output reached 2.118 billion tons in 2022.
