The global Enhanced Geothermal Energy Systems market size is predicted to grow from US$ million in 2025 to US$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Enhanced Geothermal Energy Systems (EGS) is a technology that harnesses geothermal energy by injecting liquid underground to enhance geothermal energy production. Traditional geothermal energy systems rely on naturally occurring hot water and steam resources, while EGS can expand the scope of geothermal energy extraction and improve energy production efficiency. The key to the EGS system is to create and maintain an artificial fracture network and ensure the stability and efficiency of hydrothermal circulation. This requires careful assessment and control of subsurface geological conditions and managing the system with appropriate injection pressures, flows and temperatures. The advantage of EGS technology is that it can develop a wider range of geothermal resources, reduce dependence on specific hot spots in the region, and effectively utilize underground thermal energy. It is expected to provide an important energy supplement for the development of renewable energy and reduce the demand for traditional fossil fuels, thereby reducing greenhouse gas emissions. However, EGS technology also faces some challenges, such as underground injection of liquid that may cause earthquakes, rock crack stability and other issues, so it needs to be treated with caution during implementation. In recent years, scientists and engineers have been working hard to overcome these challenges to promote the development and commercial application of EGS technology.

United States market for Enhanced Geothermal Energy Systems is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
