An Enteric Film Coating Agent is a substance used in pharmaceutical manufacturing to apply a coating to oral solid dosage forms like tablets or capsules. This coating is designed to resist the acidic environment of the stomach and dissolve in the higher pH environment of the small intestine. Enteric coating agents typically contain polymers that are insoluble at low pH but become soluble or permeable at higher pH levels. This property allows the coated dosage form to pass through the stomach intact and release the drug in the intestine where it can be absorbed effectively.

The global Enteric Film Coating Agent market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
