Enteric methane inhibitors are substances added to the diets of ruminant animals, such as cows and sheep, to reduce the amount of methane they produce during digestion. Methane is a potent greenhouse gas emitted primarily through a natural process called enteric fermentation, which occurs in the stomachs of ruminants. These inhibitors work by targeting the microbes responsible for methane production in the animals' digestive systems, without harming the animals or affecting their productivity. By decreasing methane emissions, enteric methane inhibitors help mitigate the environmental impact of livestock farming and support more sustainable agriculture.

United States market for Enteric Methane Inhibitors is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
