According to this study, the global Enteric Methane Mitigation Technology market size will reach US$ 145 million by 2031.

Enteric methane mitigation refers to strategies aimed at reducing methane emissions produced during the digestive process of ruminant animals, such as cows, sheep, and goats. These animals emit methane as a byproduct of fermentation in their stomachs, particularly the rumen, where microbes break down fibrous plant material. Methane is a potent greenhouse gas, and enteric emissions are a major source of agricultural greenhouse gases. Mitigation approaches include dietary changes (like adding fats or seaweed), feed additives (such as 3-NOP or probiotics), genetic selection, and improved animal management practices. Reducing enteric methane helps lower the environmental impact of livestock production while maintaining productivity.

United States market for Enteric Methane Mitigation Technology is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

China market for Enteric Methane Mitigation Technology is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.

Europe market for Enteric Methane Mitigation Technology is estimated to increase from US$ million in 2024 to US$ million by 2031, at a CAGR of % from 2025 through 2031.
