The global Enteric Vacant Hypromellose Capsule market size is predicted to grow from US\$ 298 million in 2025 to US\$ 490 million in 2031; it is expected to grow at a CAGR of 8.6% from 2025 to 2031.

The enterosoluble vacant capsules from hypromellose has effectively overcome the insufficiency of the molecular construction occurrence when protein encounters alcohols. It conducts an organic integration with the enteric coating, using its surface insufficiency, as a result, the product attains a still higher acid-resistance and more safety. After wrapping the enteric solution the enterosaluble vacant capsules from hypromellose doesn't change its tenacity, which more facilitates the filling, storage and transportation.

Hollow capsules, also known as gelatin capsules or empty capsules, are a common pharmaceutical and nutraceutical dosage form used to encapsulate various active ingredients, such as drugs, dietary supplements, and herbal extracts. The pharmaceutical industry is a major consumer of hollow capsules. The continued growth of the pharmaceutical sector, driven by factors like an aging population and the development of new drugs, has contributed to the demand for capsules. The nutraceutical and dietary supplement industries have witnessed significant growth, with consumers seeking wellness and preventive health solutions. Hollow capsules are used to encapsulate vitamins, minerals, herbal extracts, and other supplements. The growth of biopharmaceuticals, including biologics and biosimilars, has led to increased demand for specialized capsules designed for specific drug delivery requirements.
