Enteroviruses are a group of viruses which cause mild or moderate symptoms such as fever, cold and infectious conditions. Enterovirus can be dangerous if the infection spreads to the central nervous system. Enteroviruses mostly spread due to contact with the saliva or sputum of an infected person. Enteroviruses can create complications in individuals with health conditions such as pneumonia, brain diseases, and heart conditions. Enteroviruses kit uses PCR (polymerase chain reaction) method to make billions of copies of extracted DNA from the human sample for detailed study in laboratories. Enterovirus kits are ready to use detection kits, in which extracted DNA from the human body is added to ready to use PCR (polymerase chain reaction) master mix. Moreover, enterovirus kits include all necessary reagents which are used to detect the virus.
