Enterprise Decentralized Digital Identity Management (EDDIM) is an approach that involves managing digital identities using decentralized technologies, such as blockchain. This method allows for enhanced security, privacy, and control over identity data, providing significant benefits for organizations. Decentralized digital identity management systems use blockchain and similar technologies to enable a user-centric approach to identity verification. Instead of relying on a central authority to verify and manage identities, this system allows individuals to control their own identity data. This method is often built upon distributed ledger technology (DLT), which ensures the security and integrity of data without the need for a central control point.

The global Enterprise Decentralized Digital Identity Management market size is projected to grow from US$ 47.9 million in 2024 to US$ 269 million in 2030; it is expected to grow at a CAGR of 33.3% from 2024 to 2030.
