Environmental soil sampling devices are specialized equipment used in environmental monitoring and pollution investigations for standardized soil sampling. Their core purpose is to obtain soil samples from different depths and layers while maintaining sample representativeness and traceability as much as possible, for the detection and analysis of indicators such as heavy metals, organic pollutants, and nutrients. These devices typically consist of a sampling drill, a core tube, a power or manual drive system, and a sealed preservation assembly. They are widely used in contaminated site investigations, farmland environmental monitoring, construction land risk assessments, and ecological restoration projects, and are an indispensable basic sampling tool in environmental assessment and governance decision-making. Sales in 2025 were 360,000 units, with an average price of \$52 per unit. Total production capacity was 450,000 units, with a gross profit margin of 60%.

United States market for Environmental Soil Sampling Device is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
