The global Environmentally Friendly Industrial Cleaning Agents market size is predicted to grow from US\$ 35050 million in 2025 to US\$ 54510 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

In 2024, global sales of environmentally friendly industrial cleaning agents reached 1.85 million tons, with an average selling price of RMB 18,200 per ton. Environmentally friendly industrial cleaning agents mainly refer to industrial cleaning agent systems that use low-VOC, water-based, bio-based, or biodegradable formulas to replace traditional solvent-based cleaning chemicals. They are widely used in equipment manufacturing, electronics, food processing, automotive parts, energy and chemical industries, and public facility maintenance. Upstream raw materials include bio-based surfactants (coconut oil-based/corn sugar-based), water-based solvents (propylene glycol/lactic acid esters), chelating agents (GLDA/IDS), corrosion inhibitors, and additives. Bio-based raw materials account for approximately 42% of the total cost, solvents 28%, and functional additives 18%. Global total production capacity reached 2.3 million tons in 2024, with an average gross profit margin of approximately 24%-31%. Downstream consumption is structured as follows: machinery manufacturing accounts for 32%, electronics and precision equipment 21%, food processing and pharmaceutical cleanroom sectors 14%, and the automotive and transportation industries 18%. The demand for this product is primarily driven by increasingly stringent global environmental regulations (low VOCs, ban on chlorinated solvents), rising cleanliness standards in manufacturing, the widespread adoption of automated cleaning equipment on production lines, and the green alternative opportunities arising from ESG requirements. Future business opportunities are concentrated in three areas: first, the rapid penetration of bio-based alternative formulations (leading to continued expansion of upstream demand for palm oil, corn starch, etc.); second, ultra-low residue precision

cleaning agents for the electronics manufacturing and new energy sectors; and third, integrated "equipment + consumables" solutions linked to automated cleaning equipment, offering stronger stickiness and profitability. Overall, this market is still in a phase of structural upgrading and accelerated substitution, and is expected to maintain considerable growth over the next 5-8 years.

The core trend in the environmentally friendly industrial cleaning agent market is driven by a dual force of "strong substitution + high standards." On the one hand, global manufacturing customers are rapidly shifting from traditional chlorine-, phosphorus-, and high-VOC solvent systems to water-based, bio-based, and low-hazard chemical systems. This substitution speed is particularly pronounced in Europe, the US, Japan, and South Korea, where regulations are more stringent. This directly boosts the market share of high-performance environmentally friendly cleaning agents. On the other hand, downstream industries (such as power batteries, precision electronics, medical devices, and food processing) have significantly increased their requirements for cleaning residue, particulate matter control, non-corrosiveness, and material compatibility. This has transformed cleaning agents from "low-value-added consumables" into "key process materials," leading to a simultaneous increase in industry profit margins and technological barriers.

From the supply side, competition is shifting from formula cost competition to competition for technological solutions, including customized formulations, online cleaning process optimization, and collaborative development of cleaning equipment. Companies that establish an integrated "chemicals + equipment + process" model will have greater stickiness and profit margin advantages. Market opportunities will be concentrated in three sectors: First, large-scale green substitution driven by declining prices of bio-based raw materials; second, increased demand for high-purity chemicals in the new energy vehicle battery manufacturing chain (electrode sheets, structural components, and module segments); and third, export-oriented formulations that meet overseas compliance requirements (REACH, EPA Safer Choice). Overall, the industry is transitioning from full competition to technology-driven competition, possessing long-term growth certainty.
