Enzymatic hydrolysis of animal proteins is a process in which animal proteins are broken down into smaller peptides or amino acids through the action of enzymes. This process is often used in food processing, biotechnology and medicine. Through enzymatic hydrolysis, large animal protein molecules can be broken down into small molecules that are easier to digest and absorb, thereby improving the bioavailability of the protein. Enzymatic hydrolysis of animal protein usually involves the action of a series of enzymes, such as protease, trypsin, etc. The action conditions and types of enzymes will affect the efficiency of enzymatic hydrolysis and the characteristics of the products. The products of enzymatic hydrolysis of animal protein can be used as food additives, nutritional supplements, pharmaceutical raw materials, etc.
