Enzyme replacement therapy (ERT) is a medical treatment whereby replacement enzymes are given to patients who suffer from chronic conditions resulting from enzyme deficiencies or malfunction. The most common method of ERT is through IV infusions, in which the replacement enzyme is administered directly into the bloodstream through a controlled drip of fluids. Replacement enzymes for ERT are derived from human, animal, and plant cells that are then genetically modified and processed before being given to the patient. By receiving these enzyme replacements, the body is able to successfully perform the functions inhibited by the deficiency. The effectiveness of ERT varies from person to person and what is being treated, but in some cases it is the only available treatment option.
