Abstracts

The global Eosinophilic Asthma Treatment market size is predicted to grow from US\$ 48126 million in 2025 to US\$ 174426 million in 2032; it is expected to grow at a CAGR of 18.3% from 2026 to 2032.

Eosinophilic asthma treatment focuses on managing a severe subtype of asthma characterized by elevated levels of eosinophils, a type of white blood cell that contributes to inflammation in the airways. Traditional therapies, such as inhaled corticosteroids and bronchodilators, often prove insufficient for patients with this phenotype. Monoclonal antibodies such as mepolizumab, reslizumab, and benralizumab target interleukin-5 (IL-5) or its receptor, effectively reducing eosinophil levels and decreasing the frequency of exacerbations. The management strategy also includes identifying eosinophilic biomarkers through blood tests or sputum analysis to ensure accurate diagnosis and therapy alignment.

Eosinophilic asthma is a phenotype of asthma characterized by elevated airway eosinophilic inflammation, particularly prevalent in patients with moderate to severe and recurrent acute exacerbations. From a pharmaceutical market perspective, this field has historically relied primarily on inhaled corticosteroids, LABAs, and, when necessary, oral corticosteroids to control symptoms. In recent years, however, it has clearly entered a precision medicine phase centered on patient phenotype identification and targeted biologic therapy. This is driving the eosinophilic asthma market away from the traditional approach of "treating all asthma patients with similar pathways" towards stratified treatment based on characteristics such as eosinophil levels, FeNO, allergic status, history of acute exacerbations, and nasal polyps.

Biologics are becoming the most important driver of growth in the eosinophilic asthma

market, with the IL-5/IL-5R? pathway remaining the most direct and mature core pathway. Mepolizumab and reslizumab reduce eosinophilic inflammation by inhibiting IL-5 signaling, while benralizumab targets IL-5R? and directly depletes eosinophils. Meanwhile, dupilumab blocks IL-4R?, reaching a broader range of Type 2 inflammation patients, while tezepelumab intervenes from the upstream TSLP pathway, showing therapeutic value in some severe asthma patients with low eosinophil counts. Therefore, future market competition will not simply be a competition between anti-IL-5 drugs, but will evolve into a patient-stratified competition among IL-5/IL-5R, IL-4/IL-13, TSLP, and next-generation dual-target drugs. Treatment selection will increasingly rely on precise biomarkers and companion diagnostic systems.
