EPB actuators refer to Electronic Parking Brake actuators. An electronic parking brake (EPB) is a mechanism that replaces the traditional handbrake lever or foot pedal with a switch or button to engage and disengage the parking brake. The EPB system utilizes actuators to apply or release the parking brake when commanded by the driver or vehicle's control system. These actuators are responsible for generating the force necessary to engage the brake mechanism within the rear brakes of the vehicle. EPB actuators are controlled by the vehicle's electronic control unit (ECU), which receives input from the driver or various sensors to determine when to engage or disengage the parking brake.

The global EPB Actuators market size is projected to grow from US\$ 1677 million in 2024 to US\$ 2171 million in 2030; it is expected to grow at a CAGR of 4.4% from 2024 to 2030.
