Epidural and spinal anesthesia are both techniques used in regional anesthesia to numb specific areas of the body for surgery or pain relief. Epidural anesthesia involves injecting local anesthetics and sometimes opioids into the epidural space of the spine, which is outside the sac containing cerebrospinal fluid. This numbs the nerves as they exit the spinal cord, providing pain relief for procedures such as childbirth or surgery on the lower abdomen or legs. Spinal anesthesia, on the other hand, involves injecting anesthesia directly into the cerebrospinal fluid in the subarachnoid space of the spine. This produces a rapid onset of anesthesia that affects a larger area of the body, making it suitable for procedures like lower abdominal surgery or childbirth.

The global Epidural and Spinal Anesthesia Drug market size is projected to grow from US\$ 1289 million in 2024 to US\$ 1716 million in 2030; it is expected to grow at a CAGR of 4.9% from 2024 to 2030.
