Epilepsy is a disorder of the brain characterized by repeated seizures. A seizure is usually defined as a sudden alteration of behavior due to a temporary change in the electrical functioning of the brain. Normally, the brain continuously generates tiny electrical impulses in an orderly pattern. These impulses travel along neurons - the network of nerve cells in the brain - and throughout the whole body via chemical messengers called neurotransmitters. In epilepsy, the brain's electrical rhythms tend to become imbalanced, resulting in recurrent seizures. Moreover, in patients with seizures, the normal electrical pattern is disrupted by sudden and synchronized bursts of electrical energy that may briefly affect their consciousness, movements, or sensations.
