Abstracts

The global Epoxidized Bio-based Plasticizers market size is predicted to grow from US\$ 636 million in 2025 to US\$ 1169 million in 2032; it is expected to grow at a CAGR of 8.8% from 2026 to 2032.

Epoxidized bio-based plasticizers are plasticizers and heat co-stabilizers produced from renewable feedstocks such as vegetable oils or fatty acid esters through epoxidation. Common products include epoxidized soybean oil, epoxidized linseed oil and epoxidized fatty acid esters. They are mainly used in PVC and related polymer systems to provide flexibility, heat stability, acid scavenging and low volatility. In 2025, global Epoxidized Bio-based Plasticizers production reached approximately 361 K MT.

Demand for epoxidized vegetable-oil plasticizers is growing due to phthalate-free formulation, food-contact safety and renewable-feedstock use. PVC flooring, packaging films, wire and cable, medical products and sealants are using products such as ESBO to reduce reliance on conventional phthalate plasticizers while improving heat stability and processing latitude.

The market is still affected by vegetable oil prices, epoxy value stability, odor and migration performance. Premium customers focus on food-contact, medical, low-volatility and color-stability indicators, requiring suppliers to improve product consistency through feedstock selection, refining and epoxidation process control. Companies with large-scale vegetable oil sourcing and fine-processing capability have cost advantages.

From a substitution trend, epoxidized bio-based plasticizers are often used with primary plasticizers and stabilizers to balance flexibility, heat stability and migration control. Food-contact, medical, children's products and low-VOC applications will support

demand for higher-purity, low-odor and color-stable grades.'
