## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Epoxy liquid solder mask is a special coating commonly used in the manufacturing and assembly process of electronic circuit boards (PCBs). It is coated on the surface of the circuit board to protect the circuit components and connectors on the circuit board to prevent them from being corroded and damaged by environmental factors. Epoxy liquid solder mask is usually composed of epoxy resin and an appropriate amount of solvent to form a liquid state with high fluidity. After being applied to the circuit board surface, the liquid solder mask solidifies into a hard, corrosion-resistant protective layer through heating or chemical reaction. This cured film has good electrical insulation properties, chemical stability and high temperature resistance, and can effectively protect the electronic components on the circuit board from moisture, corrosive chemicals, high temperatures and other factors in the environment. . During the PCB manufacturing process, epoxy liquid solder resist is generally coated on the pads and soldering pads of the circuit board to prevent damage to the surface of the circuit board caused by heat and flux during the soldering process. At the same time, it can also improve the quality and reliability of welding and reduce defects and virtual welding during the welding process.

The global Epoxy Liquid Solder Masks market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
