The global Epoxy Polyester Coating for Semiconductor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Epoxy Polyester Coating is widely used in the semiconductor industry for protecting sensitive equipment and components from various forms of damage, including corrosion, wear, and static discharge. This type of coating combines the durability of epoxy with the flexibility and UV resistance of polyester, making it well-suited for environments with strict cleanliness and electrical safety standards, like semiconductor manufacturing.

Powder coatings lack solvents, giving way to negligible volatile organic compound (VOC) emission into the atmosphere and reducing the risk of combustion during their usage and storage process. In addition, the powder can be easily washed when exposed to human skin, which reduces the risk of health problems for operators. ETFE is excellent in processability and able to form a thick and non-stick film layer with electrical, mechanical and chemical strength. FEP and PFA Coating Powder are low in melt viscosity and excellent in melt fluidity which can give a coating free of pinholes.
