More commonly used in prepreg composite manufacturing are thermoset prepregs. The main resin matrix used is epoxy resin. Other thermoset resins are made into prepregs, including BMI and phenolic resins. With thermoset prepreg, the thermoset resin starts as a liquid and completely impregnates the fiber reinforcement. Excess resin is precisely removed from the reinforcement. At the same time, the epoxy undergoes partial curing, changing the resin's state from liquid to solid. This is called 'Phase B'. During the B stage, the resin is partially cured and usually tacky. When resin is raised to high temperatures, it will often return to a liquid state briefly before completely hardening. After curing, the thermoset resin in stage b is now fully cross-linked. The prepared composite materials have been widely used in aerospace, wind power generation, high-speed rail, automobiles, fishing gear, rowing and other fields. This report studies epoxy resins for prepregs.

The global Epoxy Resin for Prepreg market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
