The global Equine Chorionic Gonadotropin (eCG) market size is predicted to grow from US\$ 276 million in 2025 to US\$ 385 million in 2032; it is expected to grow at a CAGR of 5.0% from 2026 to 2032.

In 2024, global Equine Chorionic Gonadotropin production reached approximately 31.47 million units, with an average global market price of around US\$8.5 per unit. Equine chorionic gonadotropin (eCG), also known as pregnant mare serum gonadotropin (PMSG) or equine luteinizing hormone. Equine chorionic gonadotropin is a gonadotropic hormone produced in the chorion of pregnant mares. It is a glycoprotein hormone secreted by fetal-origin trophoblastic epithelial cells that form the endometrial cups.

Equine Chorionic Gonadotropin (eCG) is a highly active biological hormone widely used in animal reproduction management and livestock production. With the modernization and intensification of global livestock farming, there is increasing demand to improve reproductive efficiency and overall productivity, which has steadily expanded the eCG market. In addition, the growing adoption of research techniques and in vitro fertilization has further promoted the application of eCG in scientific studies and assisted reproductive technologies. In the future, improvements in manufacturing processes and quality control are expected to enhance the stability and safety of eCG products, providing more efficient reproductive management tools for the livestock industry. Moreover, trends such as animal welfare, sustainable farming practices, and biotechnological innovations are likely to drive the development of eCG toward higher purity, greater biological activity, and customized formulations, creating new market opportunities. Overall, the eCG market demonstrates strong growth potential, with expanding application areas and significant room for technological advancement. Its role in optimizing animal reproduction and supporting modern farming practices ensures

continued relevance and demand in the evolving livestock industry.
