The global Equipment Digital Operation and Maintenance System market size is predicted to grow from US\$ 1418 million in 2025 to US\$ 2869 million in 2032; it is expected to grow at a CAGR of 10.7% from 2026 to 2032.

The digital operation and maintenance system for equipment is a comprehensive management platform that integrates the Internet of Things, big data analysis, and artificial intelligence technologies, and is designed to monitor, analyze, and optimize the operating status of equipment in real time. Through data collection and analysis, the system can provide accurate fault predictions, optimized maintenance strategies, and automated operation and maintenance operations, thereby improving equipment reliability and efficiency, and reducing unplanned downtime and operation and maintenance costs. The digital operation and maintenance system for equipment helps companies achieve the transition from passive maintenance to active maintenance, and promotes the development of equipment management towards intelligence and refinement.

The upstream of the equipment digital operation and maintenance system industry chain mainly includes sensor and IoT hardware suppliers (such as temperature, pressure, vibration, and flow sensors, PLC/edge controllers), industrial communication modules (5G/industrial Ethernet/LoRa, etc.), cloud computing and storage platforms, and data acquisition and processing software tool providers; the midstream consists of equipment digital operation and maintenance system integrators and software service providers, responsible for integrating IoT-collected data, historical operation and maintenance records, digital twin models, AI prediction algorithms, and visualization platforms to provide enterprises with services such as fault prediction, health

management, energy consumption optimization, and remote monitoring. The gross profit margin of this segment is usually between 40% and 60%, depending on the degree of customization and the added value of software algorithms; the downstream targets fields such as industrial manufacturing, energy and power, transportation, public facilities, building and smart city operation and management, and delivers digital operation and maintenance management of equipment throughout its entire life cycle through subscription SaaS, system integration projects, or long-term operation and maintenance services.

The application of digital equipment operation and maintenance systems marks an important step towards intelligence and refinement in the field of operation and maintenance. By integrating the Internet of Things, big data analysis, and artificial intelligence technologies, these systems can monitor equipment status in real time, provide accurate fault predictions and timely maintenance recommendations, thereby extending equipment life, reducing unplanned downtime, and improving production efficiency. In addition, digital equipment operation and maintenance systems can also optimize resource allocation and operation and maintenance processes through data-driven insights, helping companies reduce operating costs and achieve higher management efficiency and competitiveness. In short, digital equipment operation and maintenance systems not only innovate traditional equipment management models, but also provide solid technical support for the digital transformation and sustainable development of enterprises.
