The global Erbium-doped Fiber Laser Therapeutic Instrument market size is predicted to grow from US\$ 154 million in 2025 to US\$ 228 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

An Erbium-doped Fiber Laser Therapeutic Instrument is a non-ablative fractional laser device used in dermatology and medical aesthetics. It works by delivering 1540-1565 nm laser energy into water-containing skin tissue to create controlled microthermal zones in the dermis, stimulating collagen remodeling and tissue repair while largely preserving the epidermis. This makes it suitable for low-downtime treatment of skin rejuvenation, acne scars, surgical scars, fine lines, enlarged pores, uneven texture, stretch marks, and dyschromia. In 2025, Global Erbium-doped Fiber Laser Therapeutic Instrument recorded estimated shipments of about 3,500 units, with an average selling price of around 45,000 k US\$/Unit. The value chain of Erbium-doped Fiber Laser Therapeutic Instruments starts with erbium-doped fiber or Er:Glass laser modules, pump diodes, fiber couplers, scanning galvanometers, fractional scanner heads, cooling systems, treatment handpieces, sensors, power supplies, control software, and medical-grade housings.

The growth of the Erbium-doped Fiber Laser Therapeutic Instrument market is primarily driven by the shift in dermatology and aesthetic medicine from aggressive ablative resurfacing toward repeatable, low-downtime, lower-risk, and multi-skin-type-compatible non-ablative fractional procedures. Around 1550 nm, erbium fiber or Er:Glass laser energy is absorbed by water-containing dermal tissue and creates controlled microthermal zones that stimulate collagen remodeling without fully ablating the epidermis, making the technology suitable for acne scars, fine lines, pores, texture irregularities, dyschromia, photodamage, and combination-based aesthetic treatment

protocols.
