## Abstracts

The global ERP Software for Automotive Industry market size is predicted to grow from US\$ 736 million in 2025 to US\$ 1136 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

ERP Software for Automotive Industry is an enterprise resource planning system designed specifically for the automotive industry. By integrating core business processes such as procurement, production, sales, and finance, it addresses the unique challenges of the automotive industry, including complex supply chain collaboration, strict quality traceability, and refined production management. The industry's gross profit margin can reach 60%-70%. The upstream of the supply chain primarily focuses on IT infrastructure and basic software, including hardware such as servers and storage, as well as operating systems and databases. The midstream involves the design, development, and integration of ERP software, involving the development of automotive-specific functional modules and integration with systems such as MES (Manufacturing Execution Systems) and PLM (Product Lifecycle Management). Downstream end users include various automotive manufacturers, parts manufacturers, distributors, and dealers, and are applied to business processes such as vehicle manufacturing, parts production, sales, and after-sales service.

The main market drivers include the following:

### Industry Characteristics Driving Upgraded Management Needs

The automotive industry is characterized by a long supply chain, numerous production stages, and high levels of collaboration. From raw material procurement to vehicle delivery, it involves hundreds of suppliers, multi-level distributors, and complex

production processes. These characteristics require ERP systems with strong resource integration and process optimization capabilities to achieve supply chain transparency, precise production scheduling, and dynamic inventory management. For example, real-time tracking of parts inventory, production progress, and logistics information through an ERP system can reduce downtime due to material shortages and inventory backlogs, improving overall operational efficiency. Simultaneously, the automotive industry has stringent requirements for quality traceability and compliance management. ERP systems must support full lifecycle quality control and regulatory compliance verification to ensure products meet safety, environmental, and other standards, satisfying industry regulatory needs.

### Technological Innovation Promoting Intelligent System Transformation

The rapid development of technologies such as cloud computing, big data, and artificial intelligence has infused automotive industry ERP software with intelligent capabilities. Cloud-native ERP supports flexible deployment and elastic expansion, enabling rapid response to business changes; AI algorithms can achieve demand forecasting, intelligent production scheduling, and fault warnings, improving decision-making accuracy; and big data analytics can uncover deep-seated patterns in production and sales processes, optimizing resource allocation. Furthermore, IoT technology enables ERP systems to collect equipment status and energy consumption data in real time, achieving visualization and controllability of the production process. Technological innovation not only expands the functional boundaries of ERP systems but also drives the transformation from 'post-event management' to 'pre-event prediction and in-event control,' meeting the automotive industry's higher demands for agility and intelligence.

### Market competition and industrial upgrading generate new demands

Intensified competition and industrial upgrading trends in the automotive industry are driving companies to shift from 'scale expansion' to 'quality and efficiency,' extending the demand for ERP systems from basic management to strategic support. On the one hand, the rise of new energy vehicles and intelligent connected vehicles brings new business modules such as battery management and software-defined vehicles, requiring ERP systems to have a modular and scalable architecture to adapt to emerging business needs. On the other hand, the growing demand for globalization and cross-regional collaboration requires ERP systems to support international functions such as multilingual, multi-currency, and multi-tax systems to meet the needs of multinational operations. Simultaneously, the trend of customer personalization (such as the C2M model) requires ERP systems to achieve flexible production and rapid

response, improving customer satisfaction and market competitiveness. Market competition and industrial upgrading are jointly driving the evolution of ERP systems into strategic platforms, making them the core engine of enterprise digital transformation.
