The global Erythropoietin (EPO) market size is predicted to grow from US\$ 10580 million in 2025 to US\$ 15020 million in 2031; it is expected to grow at a CAGR of 6.0% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Erythropoietin is produced by interstitial fibroblasts in the kidney in close association with peritubular capillary and proximal convoluted tubule. It is also produced in perisinusoidal cells in the liver. While liver production predominates in the fetal and perinatal period, renal production is predominant during adulthood.

Erythropoietin is an essential hormone for red blood cell production. Without it, definitive erythropoiesis does not take place. Under hypoxic conditions, the kidney will produce and secrete erythropoietin to increase the production of red blood cells by targeting CFU-E, proerythroblast and basophilic erythroblast subsets in the differentiation. Erythropoietin has its primary effect on red blood cell progenitors and precursors (which are found in the bone marrow in humans) by promoting their survival through protecting these cells from apoptosis, or cell death.

In this report, we definite one unit for 1ml, except Epoetin-alfa type, which one unit means 10000units/ml

The major players in global Erythropoietin market include Amgen, Johnson & Johnson, etc. The top 2 players occupy about 60% shares of the global market. North America is the main market, and occupies over 65% of the global market. Epoetin-alfa is the main type, with a share about 80%. Kidney Disorders is the key application, which holds a

share over 40%.
