Electrostatic Discharge (ESD) is a growing problem in industry. In an increasingly technological age requiring more sophisticated electronic components, the familiar shock we receive when walking across a carpet, or shuffling around in a chair, can be costly or dangerous. Static discharge can ignite flammable mixtures or vapors in laboratories and damage electronic components in electronics manufacturing. Static electricity can attract contaminants in clean environments or cause products to stick together. ESD is the rapid exchange of electricity from one object to another. It occurs when static electricity builds up on the surface of any non-conductive object that rubs against another similar non-conductive object.
