Esophageal Temperature Management System refers to measures to manage and monitor esophageal temperature. Cardiac ablation is a procedure used to treat arrhythmias by using high-frequency electrical energy or cryotechnology to destroy areas of abnormal conduction in the heart tissue. Catheter ablation for atrial fibrillation carries a higher risk of complications than other ablation procedures. In order to prevent the occurrence of complications such as esophageal fistula penetrating the left atrium and esophagus, esophagitis, and esophageal ulcer, which has a particularly high mortality rate, the esophageal temperature needs to be monitored and controlled. ETM typically monitors esophageal temperature in real time by placing a temperature probe or catheter in the esophagus and using a temperature monitoring instrument. Based on the monitoring results, doctors can take appropriate measures, such as adjusting energy output or stopping the operation, to ensure that the esophagus is properly protected.

The global Esophageal Temperature Management System market size is projected to grow from US\$ 259 million in 2024 to US\$ 556 million in 2030; it is expected to grow at a CAGR of 13.6% from 2024 to 2030.
