Esophageal Temperature Management System refers to measures to manage and monitor esophageal temperature. Cardiac ablation is a procedure used to treat arrhythmias by using high-frequency electrical energy or cryotechnology to destroy areas of abnormal conduction in the heart tissue. During cardiac ablation, esophageal temperature needs to be monitored and controlled in order to protect the esophagus from thermal or cryoenergy damage. ETM typically monitors esophageal temperature in real time by placing a temperature probe or catheter in the esophagus and using a temperature monitoring instrument. Based on the monitoring results, doctors can take appropriate measures, such as adjusting energy output or stopping the operation, to

ensure that the esophagus is properly protected.
