The global eSource for Clinical Trials market size is predicted to grow from US\$ 636 million in 2025 to US\$ 962 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

eSource for clinical trials refers to software platforms that capture source data electronically at clinical research sites or in remote trial settings. These systems connect investigator records, patient-reported outcomes, EHR data, laboratory data, imaging data, wearable-device data and EDC platforms, reducing delays and errors caused by transcribing paper source documents into EDC. The core value of eSource is to improve real-time data availability, completeness and auditability while reducing source-data verification, data-cleaning and site-monitoring burden, especially in complex, multi-site, decentralized and real-world-data-enabled trials. The eSource value chain starts with cloud infrastructure, EHR interfaces, FHIR/CDISC standards, identity management, cybersecurity and compliance-audit technologies, moves through eSource, EDC, eCOA, eConsent and clinical-data platform vendors, and serves pharmaceutical companies, CROs, hospital research sites, SMOs and investigator-initiated trials.

Growth in eSource for clinical trials is driven by increasing trial complexity, heavier data-entry burden at research sites, wider adoption of remote and hybrid trials, and continued regulatory focus on data integrity and traceability. The traditional model of transcribing paper source documents into EDC creates transcription errors, monitoring cost and data-cleaning delays, while eSource improves data quality and cycle time through direct electronic capture, EHR-to-EDC connectivity and real-time audit trails.
