The global eSSD for AI Servers market size is predicted to grow from US\$ 16839 million in 2025 to US\$ 83079 million in 2032; it is expected to grow at a CAGR of 22.9% from 2026 to 2032.

eSSD for AI servers refer to enterprise-level solid-state drives deployed in AI training/inference servers and data center infrastructure. They typically use PCIe interfaces and the NVMe protocol, employing NAND flash memory as the storage medium. Flash memory management is achieved through controllers and firmware, providing high throughput, low and stable latency (QoS), and high reliability under high concurrency, multi-queue, and prolonged full-load conditions. They are commonly used for local caching of AI datasets, high-speed provisioning of training data, model checkpoint writing, vector database indexing, log and metadata disks, and distributed storage/software-defined storage acceleration layers. They must also meet the security (SED/FIPS, etc.), manageability (telemetry, health monitoring), and compatibility (server platform certification) requirements of data centers.

In terms of price, there is a significant price difference between PCIe Gen4 and PCIe Gen5. In 2025, based on a price of \$140/TB, the consumption of enterprise-grade SSDs for AI servers is projected to reach 122.95 billion GB.
