Estradiol patches are a form of hormone replacement therapy (HRT) that deliver the hormone estradiol, a type of estrogen, through the skin. These patches are typically prescribed to treat symptoms of menopause, such as hot flashes, night sweats, vaginal dryness, and mood swings, by replenishing the body's reduced estrogen levels. They are applied to the skin, usually on the lower abdomen or buttocks, and slowly release estradiol into the bloodstream. This method is often preferred over oral estrogen because it bypasses the liver, potentially reducing the risk of certain side effects. Estradiol patches are also used in managing conditions like hypoestrogenism and preventing osteoporosis.
