Etching frames are used in the process of photolithography to hold and align photomasks or reticles during the fabrication of integrated circuits, printed circuit boards, and other microelectronic components.

Photolithography is a key process in microelectronic fabrication, where a patterned mask is used to selectively expose a photosensitive material, such as photoresist, on a substrate, followed by the chemical or physical removal of the exposed areas to create the desired pattern. The photomask is an essential component of this process, as it contains the desired pattern that will be transferred onto the substrate.

Etching frames can be customized to match the size and shape of the photomask and the substrate, and can be designed with various types of alignment mechanisms, such as mechanical pins, vacuum suction, or magnetic clamps, to ensure precise and repeatable alignment. They are essential for the high-volume and high-precision production of microelectronic devices.
