Glass etching powder, also known as glass frosting powder, can be divided into water-based frosting powder and acidic frosting powder according to the formula. Waterborne sand powder itself contains solid acid and can be directly mixed with water for use. Acidic sand powder is usually mixed with sulfuric acid and water or hydrochloric acid in a certain proportion for maturation. For glass materials such as high boron quartz glass, hydrofluoric acid is used to mix with acidic sand powder. Then, there is the issue of the acidity of the sanding solution. If the acid is high, the glass is prone to water marks after frosting, while if the acid is low, the frosting reaction time is long or cannot be covered.

The global Etching Powder for Glass market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
