End-tidal carbon dioxide (EtCO₂) is the concentration of carbon dioxide (CO₂) at the end of exhalation. EtCO₂ reflects the efficiency with which carbon dioxide is transported from its origin in metabolic cells through capillaries to the alveoli, where it is exchanged with O₂, and then exhaled through the trachea, where it reaches the nasopharynx and oropharynx, where it is released from the body. EtCO₂ is measured most accurately in intubated patients and patients wearing a tight-fitting mask (without leaks when inhaling or exhaling). EtCO₂ is directly related to metabolism, cardiac output and pulmonary blood flow, and inversely related to dead space (non-ventilated alveoli and conducting airways). Changes in EtCO₂ can signal changes in cardiovascular function and respiratory events.

The global ETCO₂ Monitor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
