## Abstracts

The global Ethernet Core Switch market size is predicted to grow from US\$ 15261 million in 2025 to US\$ 24534 million in 2032; it is expected to grow at a CAGR of 7.1% from 2026 to 2032.

In 2025, global production capacity of Ethernet core switches is approximately 620,000 units, with actual output around 480,000 units. The average market price is about US\$ 32,000 per unit. Gross margins typically range from 30% to 48%, depending on switching capacity, port density, and software capabilities. An Ethernet Core Switch is a high-performance switching device deployed at the core layer of enterprise, campus, data center, or metropolitan networks. It provides high switching throughput, low latency, high port density (10G/25G/40G/100G/400G), and advanced Layer 2/Layer 3 routing capabilities. Core switches ensure high availability through redundant architecture, hot-swappable modules, and fault tolerance mechanisms.

Upstream includes switching ASIC chips, high-speed SerDes components, optical modules, memory (DDR/HBM), power modules, cooling systems, and network operating systems. Midstream involves hardware system design, PCB assembly, firmware and network OS development, protocol implementation (STP, VXLAN, BGP, OSPF), and system validation. Downstream applications cover large enterprises, data centers, telecom operators, government agencies, financial institutions, cloud service providers, and campus networks.

The Ethernet core switch market is supported by continuous expansion of data centers, enterprise digital transformation, and increasing demand for high-bandwidth connectivity. The proliferation of cloud computing, AI workloads, and large-scale virtualization environments is driving the transition toward 100G, 400G, and even 800G switching architectures.

In enterprise and campus networks, software-defined networking (SDN) and network automation are becoming standard requirements, enhancing scalability and reducing operational complexity. In data center environments, spine-leaf architectures and VXLAN-based overlays are accelerating deployment of high-performance core switching platforms.

Technological trends include higher switching capacity ASICs, programmable networking chips, AI-assisted network management, and enhanced cybersecurity integration. While market growth is moderate compared with edge devices, core switches remain critical infrastructure components, with stable demand driven by network upgrades and digital infrastructure investment.
